

ABSTRACT OF THE DISCLOSURE

A music searching device includes an operation unit that sets representative music serving as the basis for the search, and a search processing unit that compares, on the basis of degree of similarity, the representative music and pieces of music that serve as search targets, selects, on the basis of the comparison results, pieces of music having a high degree of similarity, and generates a music list where the selected pieces of music are sorted in ascending order or descending order on the basis of a played frequency associated with each of the selected pieces of music.
